| 論文題目 | How Language-Based Approaches to Online Abuse Shape Stakeholders' Agency | | |
| 要旨 | | | |
| <p>Although NLP research on online abuse is often motivated by humanistic reasons, the implicit theoretical orientations, assumptions, and values of researchers and developers can shape automated detection systems in ways that constrain non-technologists' agency and lead to adverse offline consequences. It is therefore important to investigate how technological problems are formulated, how NLP research is framed and reported, and how publications deal with matters of transparency and accountability. In this project, I use a combination of archival studies and thematic and discourse analysis to analyze 153 NLP papers on online abuse that were published between January 2019 and January 2022, focusing on how the authors conceptualize and contextualize the given problem, describe relevant stakeholders, and justify their methods. The discursive trends indicate that humanistic concerns do not necessarily translate into socially-oriented research methodologies, suggesting a need for greater methodological reflection in the field.</p> | | | |
